

DRONE DEPLOYMENT PLAN

Drone monitoring of waste is new, so we looked for the way to deploy the solution without changing your habits.

FIRST STEP : LANDFILL

First, artificial intelligence will be trained in the landfill. This will allow us to check the correct functioning of the tool on a small perimeter outside the daily life of the majority of the inhabitants. In addition, the profusion of waste will allow intensive training in AI, leading to better performance.

SECOND STEP : COMMERCIAL AREA

The second part of our thinking is to deploy drones in the city center. This is one of the dirtiest areas in Gotham, so we can quickly see the benefits of this solution. This will also allow you to adapt to the presence of drones without feeling observed by them in your privacy.

LAST STEP : EXTENDED PERIMETER

Finally, we will gradually extend the scope of action of drones to the entire city. This will dilute the investment over time and ensure the quality of the tool before deploying it close to your homes.

CONCLUSION

We hope that this deployment plan suits you, we have sought above all not to rush your daily life because your well-being is our priority.
